LABORATORY - REPORT

APPLICANT:

EB BRANDS (HK)

ADDRESS:

Unit 705 & 706, Enterprise Square, Phase 1

Tower III, 9 Sheung Yuet Road

Kowloon Bay, Kowloon

Hong Kong

DATE OF SAMPLE RECEIVED:

2011-09-22

DATE OF TESTING:

2011-10-03

DESCRIPTION OF SAMPLE:

Product:

Micro Big Rig Fueler

Model number:

6373

Additional Model number:

6372

(The remote control unit of models 6373 and 6372 are identical)

Product class:

Low Power Communication Device - Transmitter (27 MHz)

FCC ID number:

XRB6373CU27TX

Rating:

DC 3V (AA size battery x 2)

CONDITION OF TEST SAMPLE:

The received sample was under good condition.

INVESTIGATIONS REQUESTED:

Measurements to the relevant clauses of F.C.C. Rules and Regulations Part

15 Subpart C - Intentional Radiators.

RESULTS:

See the attached sheets.

CONCLUSIONS:

From the measurement data obtained, the tested sample was considered to

have COMPLIED with the requirements for the relevant clauses of Federal

Communications Commission Rules as specified above.

Stephen C.N. Wong Technical Manager

IECC a wholly-owned subsidiary of SGS Hong Kong Limited

Conducted Emission Test Setup

LEGEND:

- Interconnecting cables that hang closer than 40 cm to the groundplane shall be folded back and forth in the center forming a bundle 30 to 40 cm long (see 6.1.4 and 11.2.4).
- I/O cables that are not connected to a peripheral shall be bundled in the center. The end of the cable may be terminated, if required, using the correct terminating impedance. The overall length shall not exceed 1 m (see 6.1.4).
- 3) EUT connected to one LISN. Unused LISN measuring port connectors shall be terminated in 50 Ω . LISN can be placed on top of, or immediately beneath, reference groundplane (see 5.2.3 and 7.2.1).
 - 3.1) All other equipment powered from additional LISN(s).
 - 3.2) Multiple outlet strip can be used for multiple power cords of non-EUT equipment.
 - 3.3) LISN at least 80 cm from nearest part of EUT chassis.
- 4) Cables of hand-operated devices, such as keyboards, mice, etc., shall be placed as for normal use (See 6.2.1.3 and 11.2.4).
- Non-EUT components of EUT system being tested (see also Figure 13).
- Rear of EUT, including peripherals, shall all be aligned and flush with rear of tabletop (see 6.2.1.1 and 6.2.1.2).
- Rear of tabletop shall be 40 cm removed from a vertical conducting plane that is bonded to the groundplane (see 5.2.2 for options).

FCC - Test Report

No. 55819-1

Page 8 of 15

Date: 2011-10-07

Test Procedure

Radiated Emission:

The EUT was tested according to ANSI 63.4-2003 for the requirements of FCC Part 15 Subpart C Section 15.209 and 15.227.

1. Measurement Frequencies below 30MHz:

During the test, the sample was placed on a turn table and operated under various modes with supply from new batteries. The table is 0.8 meter and can rotate 360 degrees to determine the position of the maximum emission level. A loop antenna for the frequency range 9kHz - 30MHz, connected with 10 meters coaxial cable to the test receiver was used for measurement. The center of the loop was 1 m above the floor, positioned with its plane vertical at the specified distance and rotated about its vertical axis and placed horizontal for maximum response at each azimuth about the EUT.

An initial pre-scan was performed to find out the maximum emission level of the sample placed at 3 orthogonal planes. Final measurement was then performed to record the data for fundamental emission within the operation band and spurious emissions outside the band under worst-case condition for combination of the antenna orientation and turn table position.

Note: Fundamental emission for this pulse modulated device was measured with the peak detector function of the test receiver and was properly adjusted for the duty cycle correction factor as pulse desensitization to calculate the average emission value.

2. Measurement Frequencies 30MHz - 1000 MHz:

During the test, the sample was placed on a turn table and operated with supply from new batteries. The table is 0.8 meter above the reference ground plane on the Open Aera Test Site and can rotate 360 degrees to determine the position of the maximum emission level. A broad-band antenna for the frequency range 30 - 1000 MHz, connected with 10 meters coaxial cable to the test receiver was used for measurement. The antenna is capable of measuring both horizontal and vertical polarizations. The antenna was raised from 1 to 4 meters to find out the maximum emission level from the EUT.

An initial pre-scan was performed to find out the maximum emission level of the sample placed at 3 orthogonal planes. Final measurement (30 MHz –1000 MHz) was then performed to record the data for the emissions under worst-case condition for combination of the antenna orientation / height and turn table position.

Note: The Open Aera Test Site located at IECC was placed on file with the FCC Pursuant to Section 2.948 of the FCC Rules (FCC Registration No.: 97774).

No. 55819-1

Test Results

Radiated Emission:

FCC Part 15 Subpart C Section 15.209 and 15.227 Test Requirement:

Test Method: ANSI C63.4: 2003

Deviations from Standard Test Method: Nil

Frequency Range: 9kHz - 1000MHz

Measurement Distance: 3 m

Detector: Peak (for fundamental frequency)

Quasi-Peak (for frequencies outside the operation band)

Refer to page 10 - 14 for measurement data.

Conducted Emission:

Not Applicable

Radiated Emission

Mea Emissions (27MHz-1000MHz) FC(FCC Part 15 Subpart C

IECC Ref: 55819-1 Model:

Applicant:

EB BRANDS (HK)

Sample No.:

Set under test: Micro Big Rig Fueler Connected sets: Operating mode: Operate (accelerate)

Radiation Measurement (3 m) below 30MHz

a. Fundamental Frequency

Frequency (MHz) Maximum Test Result (dB(µV/m))

<u>Average</u> Peak 27.145 64.0 58.9

FCC Limit (dB(µV/m))

Peak Average 100

Note: (1) The above peak value is the maximum value of the measurement in 3 orthogonal planes

(2) * Calculation for radiation (average) :

Formula:

Duty cycle = (N1L1 + N2L2 + ... + Nn-1Ln-1 + NnLn) / 100 or T

where N1 is number of type 1 pluse, L1 is length of type 1 pulse, etc. T is the period of the pulse train (if less than 100 ms)

According to the time domain plots shown in page 11 & 12 : Duty cycle of the EUT = (4x1.47 + 22x0.48) / 29.72 = 0.553

Av correction factor = $20 \times \log(0.553)$ dB = -5.1 dB

Radiation (average) = Radiation (peak) + Av correction factor

Radiation (average) of the EUT = 64.0 - 5.1 dB(uV/m) = 58.9dB(µV/m)

b. Spurious Radiated Emissions

The radiated emissions outside the operation band measured by a calibrated Loop Antenna were negligible (more than 20dB below limit).
